

Report: WAN 2.1

Introduction

In this assignment we are implementing the WAN 2.1 model and adding a LORA layer to fine-tune this model on the Human Action Recognition Dataset. WAN 2.1 is an open-source suite of AI Video generation foundation models. It can perform text-to-video, image-to-video, video-editing, text-to-image and video-to-audio tasks.

Results

I was unable to get the models running through the Jupyter Notebook. Also, while trying to generate videos with the given command in the Readme for the Repository, the generate.py script would silently fail.

Insights and Obstacles

A lot of the issues I had revolved around the actual WAN 2.1 model switching data types within the model. Because of that I was unable to design a working LoRA layer that could deal with this. Maybe given more time I would have been able to make this work.
